*Q and A for the Manitoba Garden Centre sector*

## Downy Mildew- What to do?

For those who had Impatiens in their product line-up last year, you either experienced or were well aware of the impact Downy Mildew did or could have on this exceptionally radiant and beloved species. Nonetheless, for those who did experience it, it was often too late to do anything about it by the time it was diagnosed.

For those growing Impatiens this year, a preventative approach that includes Canadian registered fungicides is the best, and really the only way to prevent Downy Mildew from destroying your Impatiens crop.

However, the preventative approach involving fungicides must begin very early in the growth stage and continue throughout the crop cycle.

If you are interested in knowing more please get in touch.

## Predatory Mites- best practices

For those who use various predatory mites as part of their bio-control pest management program, proper introduction into your crop plays large part in how successful your bio-control program is.

See this article for further information;

## No helicopter? Do you spray trees or Kool-Ray?

Are you challenged with spraying into the canopy of your trees or applying Kool-Ray to your greenhouse? If so, you know how expensive some of the equipment to do so can be, including helicopter's!

<https://youtu.be/RbuSPgt-6Bg>

Even Spray is now supplying a carry around tree sprayer the intake line of which, depending product being applied, can be directly inserted into your spray tank or a tub of pre-mixed product which can then be sprayed under high pressure up to heights of 30 feet. <https://youtu.be/gtkuQf5jDFw>

## IPM refresher

With all this talk about diseases and pests and the reality that if you are a greenhouse grower you will need to manage for pests and diseases, now may be a good time for a quick refresher.
