

Pond Aerators, Fountains, & De-Icers

- **Canadian-made Floating Aerators and Dock De-Icers**
- **A Wide Range of Options to Choose from to Suit Your Specific Application**
- **Ideal for Residential, Commercial, Agricultural, and Golf Course Use**
- **All models Carry the famous Arbrux 3-Year Warranty**

Arbrux Pond Aerators are the ideal way to improve water quality. Floating surface pond aerators will circulate and aerate your pond water efficiently. Do you have algae or other water problems? Then this is what you require to improve it!

Arbrux Floating Pond Aerators are available in 1/2 to 3 horsepower models to meet all of your pond aeration needs. Built of the highest quality materials - motors and motor mounts are made of stainless steel for durability and designed to be maintenance free.

They install easily in a short time and come complete with a float, pump and submersible power cable and mooring rope. Floats are all foam filled with a closed cell foam to ensure integrity in the unlikely event the outer shell becomes compromised. Larger models are also equipped or available with outdoor control panels. All floating surface aerators can have an optional water deflector added to create a more aesthetic spray pattern. Optional water deflectors available are Lotus, Bellflower and Lily patterns.

Arbrux Dock De-icer Bubblers are the ideal solution for preventing ice damage caused by moving ice. Dock De-icer bubblers can be used to protect docks, boathouses, boat lifts, power dams, barges, boats to name a few applications.

Arbrux builds models from 1/2 horsepower 115 volt plug in models to 3 horsepower 575-volt industrial De-Icer bubblers that are designed for the harshest conditions. They are available with several power cable length options. Arbrux have been building De-Icers since 1979 and use only the best materials; motors and mounts are stainless steel for durability. Power cables remain flexible in freezing conditions and industrial models come equipped with a submersible connector to make installation easier.

Arbrux De-Icer bubblers have been used in many harsh locations including tailing ponds in northern Alberta, diamond mines in the Northwest Territories to name a few. They are Arctic proven for durability and are available in models that move from 500 to 2700 gallons per minute.

The Vertex Bottom Aeration Advantage

Designed to be both efficient and cost effective, Vertex aeration systems can aerate up to an 18 acre lake with as little as 2/3hp! Very low monthly operation costs, low maintenance (self-cleaning diffusers), and no potentially dangerous electricity in the water.

Vertex bottom aeration systems create a vertical current using the rising force of millions of small bubbles to entrain the water column, “turning the lake over” and allowing oxygen to be absorbed at the lake’s surface. By moving the lower-oxygen water up from the bottom and eliminating thermal stratification, oxygen levels throughout the water column are increased.

The Vertex aeration system consists of a small shore mounted air compressor (1/3hp - 1hp), feeding a configuration of self-cleaning flexible membrane diffusers. Positioned on the lake’s bottom, each diffuser station produces millions of small 500 – 1000 micron sized bubbles, creating a slow moving current that entrains the entire water column providing aeration through surface contact.

CoActive AirStations™ Benefits:

- 5-Year “No Questions” Warranty.
- Self-cleaning membrane diffusers = less maintenance; no need to remove.
- More energy efficient = lower operating costs
- Self-weighted tubing = easier installation
- Lifetime rust warranty on QuietAir™ Cabinets

Let Even-Spray Help Plan the Right Vertex Aeration System to Suit Your Needs!
